Programming Report

Construct Bayes classifier using Iris Data set. The classifier treats the first twenty five vectors as traning set and the remaining vectors as test set for each class. Parameters of the features are estimated based on Maximum likelihood. The assumptions are that: 1) the conditional densities of features in the classes are multivariate normal; 2) the a priori probabilities of the classes are equal.

Show the results such as correct classification rate for training and test data, respectively and confusion table.
